What's in this guide

1. Signing in and finding your way
2. Working across branches
3. Receiving a delivery (purchases)
4. How batch costing protects your profit figures
5. Managing your own products, categories and suppliers
6. Product types, including cosmetics and devices
7. Shelf labels and barcodes
8. Inventory and stock corrections
9. Running a stocktake
10. Planning what to reorder
11. Tracing stock with the ledger
12. Stock aging and value at risk
13. Moving stock between branches
14. Expiry management
15. Reports and exports
16. Customers
17. Your alerts
18. Working in Amharic
19. What your role cannot do
20. When something goes wrong

Signing in and finding your way

The same three steps every shift.

1

Open <https://pharmacare-five-ebon.vercel.app/>

Bookmark it, or add it to your phone's home screen.

2

Type your username and password

Your username is personal — never share it or sign in as someone else. Everything you do is recorded against your name.

3

**You land on the
Inventory
screen — your stock picture**

The system sends each role to the page they use most.

First sign-in, or after a password reset. You are asked to create your own password before you can do anything else. This is deliberate — it means nobody else knows it, including your manager. You need at least **10 characters** with a capital letter, a small letter, a number and a symbol. Example of the right shape (do not use this one): `Bo1e#Pharm24`

Five wrong passwords locks you out for 30 minutes. This is a safety measure against someone guessing their way in. Wait it out, or ask an Administrator to clear it. Use **Forgot your password?** on the sign-in page if you truly cannot remember it.

The top bar, button by button

BUTTON	WHAT IT DOES
	On a phone or tablet, opens the menu. Tap outside it to close.
 Globe	Switches the whole system between English and አማርኛ — including printed receipts. Your choice is remembered.
 Moon	Dark mode, easier on the eyes in a dim dispensary.
 Bell	Your alerts. A red number means unread. Click one to jump to what it is about.
Your name	My Profile (change your details or language) and Logout . Always log out on a shared computer.

Working on a phone? Everything works on a small screen. The menu hides behind ☰ and tables scroll sideways.

Working across branches

Each branch keeps its own stock. The product list, customers and suppliers are shared.

What is shared, and what each branch keeps to itself

SHARED across every branch

Product catalogue & prices · Customers & loyalty points · Suppliers · Staff accounts · Settings
One paracetamol record, one customer record — wherever they shop.

Main Branch

MAIN

Its own stock quantities
Its own batches & costs
Its own sales & purchases
Its own reorder levels
Invoices: INV-000001

Bole Branch

Its own stock quantities
Its own batches & costs
Its own sales & purchases
Its own reorder levels
Invoices: BOL-000001

Gondar Branch

Its own stock quantities
Its own batches & costs
Its own sales & purchases
Its own reorder levels
Invoices: GON-000001

You can only sell stock your own branch holds — the till will not offer another branch's shelves

Your branch is shown in the top bar next to a shop icon. You cannot change it, and that is deliberate — your account is tied to where you work.

What this means day to day: the till only offers stock your branch actually holds, and the sales you see are your branch's. If a product is missing from the till search, your branch may have none even though another branch does — ask a Store Manager about a transfer.

Receiving a delivery (purchases)

This is the most important thing you do in the system. Menu → **Purchases** → **Record Purchase**.

Supplier

Addis Pharma Distribution ▼

Purchase date

2026-08-13

+

Line items

+ Add Item

Product	Qty	Cost each	New selling price	Disc %	VAT %
Paracetamol 500mg ▼	100	30.00	60.00	0	15

Invoice total 3,450.00

SAVE PURCHASE & UPDATE STOCK

Starts with **one** row. + Add Item adds more. The yellow box is optional — fill it only if the customer price is changing.

1 Choose the Supplier and Purchase Date

Take both from the delivery note, not from today's date, if the goods arrived earlier.

2 Fill in the first line item

The form opens with exactly one row. Product (type to search), **Quantity** received, and **Cost each** — the unit cost **for this delivery**

3 Only if the customer price is changing, fill New Selling Price

The yellow box. Leave it empty to keep the current price. This changes the price from now on; sales already made keep the price they were sold at.

4 Enter Discount % and VAT % from the supplier invoice

These affect what you paid, not what you charge.

5 Press + Add Item for each additional product

Add as many rows as the delivery note needs — there is no limit. The **Invoice Total**

updates as you type, so you can check it against the supplier's figure before saving.

6 Remove a row you added by mistake

Press the ✕ on that row.

7 Save Purchase & Update Stock

Stock goes up immediately, and this delivery is stored as its own costed batch.

Check carefully before saving — purchases cannot be edited. A purchase is a financial record; letting people quietly edit one would rewrite history. If you make a mistake, an Administrator must delete it (which reverses the stock) and you record it again.

Match the invoice total on screen against the supplier's invoice before you save. Thirty seconds here saves an Administrator having to unpick it later.

How batch costing protects your profit figures

Worth understanding, because it is the reason your profit reports can be trusted.

Same product bought twice at different prices

Older batch

40 pieces
cost 20 ETB each
was sold at 50 ETB

Newer batch

100 pieces
cost 30 ETB each
now sold at 60 ETB

Kept separate, forever

Each delivery keeps its own cost.
Nothing overwrites anything.
Soonest expiry is sold first.

You sell 50 pieces

40 from older batch

$40 \times 20 = 800$

+

10 from newer batch

$10 \times 30 = 300$

=

True cost of those 50

1,100 ETB

Money in (50×60 , VAT excluded)

3,000 ETB

Gross profit

Less true cost of goods

- 1,100 ETB

1,900 ETB

Buying more later at 45 ETB does not change this figure.

Older units are costed at the older price — which is why profit stays correct

What this means in practice

- **Each delivery keeps its own cost, permanently.** Buying at a higher price never rewrites the profit on sales you already made.
- **Soonest-expiry stock is sold first (FEFO).** Not oldest-purchased — soonest-expiring, which is the right rule for a pharmacy.
- **VAT is excluded from profit.** It is collected for the tax authority and was never your margin.
- **A sale can span two batches.** Selling 50 when only 40 old units remain draws 40 at the old cost and 10 at the new one, and records both.

See it yourself: Menu → **Inventory** → **Batches** shows every delivery, its unit cost, expiry date and how much is left, in the order it will be dispensed.

One limitation worth knowing. If you add stock through *Stock In* or a *Stock Adjustment* rather than a purchase, there is no supplier invoice to cost it against, so those units take the product's current headline cost. For exact costing, always bring goods in through **Record Purchase**.

Managing your own products, categories and suppliers

Adding a product

Link medicines to the standard catalogue whenever you can — it's strongly recommended, not required. If Product Type is *Medicine*, the **Catalogue Product** field near the top of this form is where you search it out — by generic name, brand or ATC code. Once picked, the Name and Generic Name below are taken from the catalogue and can't be typed over — that's deliberate, it's what stops "Paracetamol", "paracetamol 500mg" and "PCM 500" becoming three unrelated products, and lets group reporting add the same medicine together across pharmacies. If the catalogue genuinely doesn't have what you need, you can leave it blank and type the name yourself — the form still saves it, just flagged with a **Not Standardised** badge on the list and detail page as a reminder to link it later if it turns out to exist. Every **other** product type — Cosmetic, Medical Supply, Supplement, Baby & Mother Care, Medical Device, Other — was never subject to this at all; a perfume, a bandage or a blood-pressure monitor is typed in below exactly as before.

1 Menu → Medicines → Add Medicine

The same form covers every product type, not just medicines.

2 Set the Product Type first

It decides whether a catalogue link is required and whether an expiry date is required — see below.

3 Medicine only: pick the Catalogue Product

Search by generic name, brand or ATC code. Only entries you haven't already registered are offered.

4 Name, generic name, brand

For a non-medicine type, use the name staff will actually search for — consistency matters more than perfection. For a medicine, these are filled in for you from the catalogue link.

5 Category and Supplier

Both are searchable dropdowns — start typing.

6 Barcode

If the pack has one, enter it. This is what makes scanning at the till work.

7 Batch number, manufacturing and expiry dates

Expiry is required for anything consumable.

8 Prices

Purchase Price is the current headline cost (a reference figure — real costing comes from batches). **Selling Price** is what customers pay. **Tax** and **Discount** pre-fill the till.

9 Quantity and Reorder Level

Set the reorder level to the point where you would want to order more — not zero, or the warning arrives too late.

10 Unit

Tablet, Bottle, Pack, Roll, Pair, Jar and others — pick what you actually sell it by.

11 Requires Prescription

For a medicine this comes from the catalogue's legal class and can't be changed here. For other types, tick it if it genuinely needs one.

12 Save Medicine

A code like **MED-000042** is generated automatically.

Prefer editing over deleting. Untick *Active* to retire a product; its sales history stays intact. Deleting is blocked anyway once a product has been sold.

Categories

Menu → **Medicines** → **Categories**. Keep them broad enough to be useful — a category with one product in it helps nobody. A category cannot be deleted while products are still assigned to it; move them first.

Suppliers

Menu → **Suppliers**. Record the contact person and phone — this is what someone reaches for when a delivery is late. Set *Status* to Inactive rather than deleting a supplier you have stopped using, so purchase history stays readable.

Product types, including cosmetics and devices

Medicines
tablets, syrups

Cosmetics
creams, lotions

Medical Supplies
bandages, gauze

Devices & Supports
braces, BP monitors

Supplements
vitamins

Baby & Mother
nappies, formula

All types behave identically
Same till · same stock counts · same batch costing · same reports
Nothing extra to learn per type

TYPE	EXAMPLES	EXPIRY DATE
Medicine	Tablets, capsules, syrups	Required
Cosmetic / Personal Care	Creams, lotions, soaps	Required
Medical Supply	Bandages, gauze, plasters, syringes	Required
Supplement / Vitamin	Vitamin C, multivitamins	Required
Baby & Mother Care	Nappies, formula	Required
Medical Device / Support	Knee braces, BP monitors, crutches	Optional
Other	Anything that fits nowhere else	Optional

If you leave the expiry date blank on a type that needs one, the form stops you and explains why. Items saved without an expiry are correctly left out of all expiry warnings.

Shelf labels and barcodes

1 Open the product, press Print Label

Menu → Medicines → the product → **Print Label** .

2 Check the label before printing a batch of them

It carries a scannable barcode, a QR code, the price and the expiry date.

3 If a product has no barcode of its own

The label uses the generated product code, so scanning still works at the till.

Inventory and stock corrections

TOTAL STOCK UNITS
1,284

LOW STOCK
3

OUT OF STOCK
1

EXPIRED
2 — all clickable

Current stock

PRODUCT	TYPE	QTY	EXPIRY	STATUS
Paracetamol 500mg	Medicine	492	2028-02-04	OK
Amoxicillin 250mg	Medicine	8	2026-09-02	LOW
Knee Support Brace	Medical Device	10	— none	OK
Nivea Cream 200ml	Cosmetic	27	2028-08-12	OK

The device shows “— none” for expiry. That is correct: it does not expire.

Recording a stock movement

Menu → **Inventory** → **Record Stock Movement**. Use this for anything that is not a purchase or a sale.

TYPE	USE IT FOR	WHAT TO TYPE IN QUANTITY
Stock In	Found stock, a donation, a sample, a customer return	How many to add
Stock Out	Breakage, spillage, internal use, expired write-off	How many to remove
Stock Adjustment	After a physical count	The new counted total — not the difference
Stock Transfer	Stock going to another branch	How many are leaving (a Destination is required)

Stock Adjustment is an absolute figure. If the system says 100 and you counted 94, type **94** — not 6. Getting this backwards is the most common mistake in this screen. A count of **0** is allowed and writes the product off entirely — useful when a whole batch turned out to be expired or damaged and Stock Out feels like the wrong tool because you're recording a recount, not a removal.

Always fill in Reason. The whole value of the movement log is that someone — possibly you, in three months — can understand what happened and why. "Correction" is not a reason; "counted 94 during monthly stocktake, 6 unaccounted" is.

Doing a stocktake

1 Print the Inventory report

Reports → Inventory → Print. Count against paper, not against the screen.

2 Count a section at a time

Note the actual figure beside each line.

3 Record one Stock Adjustment per discrepancy

Entering the counted total, with the reason.

4 Investigate anything large

A big gap is more likely a process problem than a counting error — check recent sales and deliveries for that product.

Running a stocktake

Menu → **Stocktakes**. This replaces correcting products one at a time.

A stocktake, start to finish

1 Start

System freezes what it thinks you have, so sales during the count don't skew it

2 Count

Type what you actually see on the shelf. Save as often as you like

3 Review

Use the "Differences only" tab. Investigate anything large before posting

4 Post

Differences are applied to stock in one go, and written to the ledger

The one thing to remember

An **empty** count box means "not counted yet" — it is never treated as zero. Anything you did not get to is left exactly as it was when you post.

1

Start the count

Pick a category to count one section, or leave it blank for the whole branch. Add a note such as "month-end, aisles 1–4". Starting the count freezes the expected figures, so sales made while you count are not mistaken for counting errors.

2

Print the count sheet

Press **Count Sheet** and count against paper, not a screen.

3

Type in what you counted

Press **Save Counts** as often as you like — a count can span shifts without losing work. Only one stocktake can be open per branch.

4

Review the differences

Use the **Differences only** tab. Investigate anything large before posting: a big gap is usually a process problem, not a miscount. Add a note against a line to explain it.

5

Post it

Differences are applied to stock in one go and written to the ledger with the stocktake reference.

An empty count box means "not counted" — never zero. Anything you did not reach is left exactly as it was when you post. This is deliberate: treating blanks as zero would wipe out stock nobody got round to counting. The posting message tells you how many products were skipped.

Posting is final. A posted stocktake cannot be posted again or edited. If you need to correct something afterwards, use a normal Stock Adjustment, or run another count.

Planning what to reorder

Menu → **Reorder Plan**.

A reorder level tells you *that* something is low. This tells you *how much* to buy. It measures units actually sold per day over the last 60 days, works out how many days of stock you have left, and suggests a quantity that restores a target number of days — adjustable at the top of the page.

It is grouped by supplier, because you place an order with a supplier, not with a spreadsheet.

COLUMN	WHAT IT MEANS
On Hand	Stock at this branch now
Sold / Day	Average daily sales over the window
Days of Cover	How long current stock lasts at that rate. Under 7 days is shown in red
Suggested Order	Quantity to restore your target days of cover

A dash in Days of Cover means the product had no sales in the window, so there is no rate to measure. The suggestion falls back to topping up to twice the reorder level. Treat those lines with more judgement than the rest — the system is guessing where you are not.

The plan is advice, not an order. When the goods arrive, record them through **Purchases** so cost and batch tracking stay accurate.

Tracing stock with the ledger

Menu → Inventory → Manage → Stock Ledger.

Where did those packs go? The ledger answers it

DATE	CAUSE	CHANGE	BALANCE	REFERENCE
10 Sep 09:14	Purchase received	+100	500 → 600	PUR-000001
10 Sep 10:02	Sale	-30	600 → 570	INV-000001
10 Sep 11:30	Stock out (breakage)	-5	570 → 565	
10 Sep 14:05	Transfer out → Bole	-40	565 → 525	→ BR-002
10 Sep 16:20	Sale voided	+30	525 → 555	INV-000001

Nothing can change stock without appearing here. Entries are never edited or deleted.

Every stock change with a running balance and the document behind it. Nothing can change stock without appearing here, and entries are never edited or deleted.

Use it when the numbers argue. Filter by product to see its whole history, or by a reference such as `PUR-000007` to see everything one delivery did. If the ledger and the shelf disagree, the shelf is right — run a stocktake.

Stock aging and value at risk

Menu → Inventory → Manage → Stock Aging.

Stock grouped by remaining shelf life and valued at **what each batch actually cost** — not the product's headline price. That distinction matters: it shows the money genuinely at risk.

Read the value column, not just the units. Twenty expiring insulin vials are a far bigger problem than two hundred expiring paracetamol tablets, and only the value column tells you that.

Moving stock between branches

Menu → Branch Stock → Transfer Stock.

Moving 40 packs from Main to Bole

Stock arrives at the cost it left at. Nothing is created or destroyed — both branches' profit figures stay correct.

1

Pick the product

Only products your branch actually holds are offered.

2

Pick the destination branch

Your own branch is not in the list.

3

Enter the quantity and a reason

You cannot send more than you have; the form tells you the real figure.

4

Transfer

Stock leaves your branch and arrives at the other one immediately, and both sides are written to the ledger.

Cost and expiry travel with the goods. Units arrive at the destination at the cost they left at, with their original expiry dates, so both branches' profit figures stay correct and the receiving branch still dispenses soonest-expiry first.

The transfer is instant in the system. There is no "in transit" state, so only record it when the goods actually move. If they will spend days on a vehicle, record the transfer at the point they arrive, or the receiving branch will appear to hold stock it cannot yet sell.

Expiry management

1 Check weekly

Inventory → Expired card, or Reports → Expired & Expiring. Use the **Within 30 days** tab to act early.

2 Move soon-to-expire stock to the front

The system already dispenses soonest-expiry first, but a physical reshuffle helps staff too.

3 Talk to the supplier while a return is still possible

Most returns need notice well before the expiry date.

4 Write off what has expired

Stock Out, reason "expired write-off". The Value at Risk column in the report tells you what it cost you.

Reports and exports

Menu → **Reports**. You have all nine, and you can export.

REPORT	USE IT FOR
Sales / Sales Summary	What sold, and revenue by day, week, month or year
Purchase	Supplier spend in a period — reconciling invoices
Profit	Revenue vs true batch cost, and margin per product
Inventory	Full stock position and stock value
Low Stock	Your reorder list
Expired & Expiring	Write-offs and value at risk
Supplier	Spend and product count per supplier
Customer	Spend and loyalty points

1 Set the date range, press Apply

2 Read the yellow summary boxes first

They carry the totals; the table is the detail behind them.

3 Export via the Export button

PDF

to send or file,

Excel

to do your own sums (numbers arrive as numbers, so they add up),

CSV

for another system.

Exports leave the system. They carry a footer noting AI-assisted output. Review any figure before it goes to a supplier or an auditor — it is a draft until a human has checked it.

A month-end routine that works

1 Sales Summary

Set the month, group by Monthly.

2 Profit

Same range — check the margin looks sane against last month.

3 Purchase

Reconcile against supplier statements.

4 Inventory

Closing stock value.

5 Expired & Expiring

Write-offs, and what is at risk next month.

6 Export each to PDF, review, then send

Customers

Menu → **Customers**. Registering someone lets them earn loyalty points and gives you their purchase history.

Registering a new customer

1 Customers → Add Customer

Name and phone number are required; email and address are optional.

2 Save Customer

They are immediately selectable at the till.

One phone number, one customer. If the number is already registered, the system refuses and *tells you which customer has it* — open that record instead of creating a second one. Two records for the same person split their history and loyalty points, which is painful to unpick later.

Spacing does not matter: 0911 22 33 44 and 0911223344 are treated as the same number.

1 Loyalty points

You can adjust these by hand when correcting a mistake. Normally they are awarded automatically on each sale.

2 Deleting a customer

Use the red bin icon. Prefer editing over deleting — deleting loses their purchase history.

Your alerts

The  bell carries the alerts that matter to your job:

- **Low stock / out of stock** — your reorder prompt
- **Expired and expiring** — your write-off and return prompt
- **New purchase recorded** — confirmation stock went up
- **Large sale** — unusually big transactions, worth a glance
- **Pending payment** — a customer paid less than the invoice total

Stock and expiry alerts clear themselves once you fix the underlying situation — you do not have to tidy them up.

Working in Amharic

Press the  globe in the top bar and choose አማርኛ.

Switching changes everything: menus, buttons, warning messages, printed receipts and exported reports. Product names stay exactly as they were typed in, because those are your own data, not part of the system's wording.

Your choice sticks to your account, so a colleague on the same computer can work in English while you work in Amharic.

What your role cannot do

TASK	WHY / WHO
Use the till	Deliberate. Your job is stock and purchasing; the counter is the Cashier's and Pharmacist's. Ask them to ring a sale
Delete a purchase	Administrator only — it reverses stock and money records
Void a sale	Administrator only
View the audit log	Administrator only
Change Settings or manage staff	Administrator only

When something goes wrong

WHAT YOU SEE	WHAT IT MEANS	WHAT TO DO
Purchase form will not save	A required field is empty or invalid	Look for the red text under a field. Every line needs product, quantity and cost
Saved a purchase with the wrong figures	Purchases cannot be edited	Ask an Administrator to delete it (stock reverses), then record it again
Stock count is wrong after a delivery	Purchase recorded twice, or not at all	Check Purchases for a duplicate; then correct with a Stock Adjustment
"This category cannot be deleted"	Products are still assigned to it	Move those products to another category first
Cannot open the till	Not part of your role, by design	Ask a Cashier or Pharmacist
Profit looks lower than expected	VAT is excluded, and true batch cost is used	Check Reports → Profit for the per-product breakdown
Expiry date field refuses to stay blank	That product type must have an expiry	Set the type to Medical Device or Other if it genuinely does not expire
Locked out after wrong passwords	Safety lock, 30 minutes	Wait, or ask an Administrator

If a patient may have been harmed — the wrong item dispensed, expired stock sold, a dosage mix-up — follow the pharmacy's clinical incident procedure **first**. The computer record can be corrected afterwards; patient safety cannot wait for paperwork.

Reporting a problem usefully

Tell your Administrator four things: **1)** what you were doing, **2)** what you expected, **3)** what actually happened (the exact wording of any message), **4)** your role and username. That is usually enough to fix it without a back-and-forth.

PharmaCare Management System · internal use only. Reports, invoices and exports are drafts for human review — check them before anything goes to a customer, supplier or regulator.
