

Administrator

Setup, staff and roles, the audit log, settings, backups and the analytics only you can see.

Written for

Administrators

Covers

Every task in your role

Languages

English / አማርኛ

What's in this guide

1. Signing in and finding your way
2. First-time setup checklist
3. The Dashboard and what each chart tells you
4. Managing branches
5. Managing staff and roles
6. The standard catalogue
7. Voiding a sale
8. Deleting a purchase
9. The audit log
10. The stock ledger
11. Settings
12. Database backup and restore
13. Notifications and keeping alerts current
14. Everything the other roles do
15. Reports and exports
16. Security you are responsible for
17. Working in Amharic
18. When something goes wrong

Signing in and finding your way

The same three steps every shift.

1

Open <https://pharmacare-five-ebon.vercel.app/>

Bookmark it, or add it to your phone's home screen.

2

Type your username and password

Your username is personal — never share it or sign in as someone else. Everything you do is recorded against your name.

3

**You land on the
Dashboard**

— yours alone

The system sends each role to the page they use most.

First sign-in, or after a password reset. You are asked to create your own password before you can do anything else. This is deliberate — it means nobody else knows it, including your manager. You need at least **10 characters** with a capital letter, a small letter, a number and a symbol. Example of the right shape (do not use this one): `Bo1e#Pharm24`

Five wrong passwords locks you out for 30 minutes. This is a safety measure against someone guessing their way in. Wait it out, or ask an Administrator to clear it. Use **Forgot your password?** on the sign-in page if you truly cannot remember it.

The top bar, button by button

BUTTON	WHAT IT DOES
	On a phone or tablet, opens the menu. Tap outside it to close.
 Globe	Switches the whole system between English and አማርኛ — including printed receipts. Your choice is remembered.
 Moon	Dark mode, easier on the eyes in a dim dispensary.
 Bell	Your alerts. A red number means unread. Click one to jump to what it is about.
Your name	My Profile (change your details or language) and Logout . Always log out on a shared computer.

Working on a phone? Everything works on a small screen. The menu hides behind ☰ and tables scroll sideways.

First-time setup checklist

Do these in order before letting staff on the system.

1 **Change the demo passwords**

The seeded accounts (`admin` , `pharmacist1` , `cashier1` , `storemanager1`) all share a known password. Change or delete them before going live. This is the single most important step on this page.

2 **Fill in Settings**

Pharmacy name, logo, phone, address, licence and TIN numbers, currency, default tax rate, invoice prefix and footer. These appear on every receipt and report.

3 **Create real staff accounts**

One per person — never a shared login, or the audit log becomes worthless.

4 **Set up categories and suppliers**

Or have your Store Manager do it.

5 **Load the catalogue**

Bring opening stock in through `Record Purchase` where you can, so costs are accurate from day one.

6 **Schedule the notification refresh**

See the Notifications section.

7 **Take a backup, and test that it restores**

An untested backup is a guess.

The Dashboard and what each chart tells you

Your landing page, and restricted to you — it shows cost prices, margins and per-staff performance.

PURCHASE VALUE (ETB)

48,320

SALES VALUE (ETB)

71,940

PROFIT SUMMARY (ETB)

23,620

EXPIRED ITEMS

2

Revenue vs Cost of Goods Sold

The gap between the bars is your gross margin

**Expiry Risk Profile**

Bars = items · red line = value at risk

Watch the red line, not just the bars — a few expensive items can outweigh a shelf of cheap ones

The KPI cards

All nine are clickable and take you to the detail behind the number.

CARD	GOES TO
Total Medicines / Categories	The catalogue lists
Low Stock / Expired	The matching stock report
Today's Sales	Sales history
Monthly Sales	Sales Summary report
Customers / Suppliers	Those lists
Purchase Value / Sales Value / Profit	The Purchase, Sales and Profit reports

Reading the analytics

CHART	WHAT TO LOOK FOR
Revenue vs Cost of Goods Sold	The gap between the bars is your gross margin. A narrowing gap month on month means costs are rising faster than prices — the most important signal on this page
Payment Method Mix	Split by revenue, not transaction count, so it shows where the money actually arrives. Useful for cash-handling and reconciliation decisions
Expiry Risk Profile	Bars are item counts; the red line is value at risk . Watch the line — a few expiring insulin packs matter far more than a shelf of cheap tablets
Top Customers by Spend	Who is worth retaining
Sales by Staff Member	Revenue served. Read it alongside shift patterns before drawing conclusions
Monthly Sales / Sales Trend	Direction of travel; the 14-day trend catches sudden drops early
Top Selling Medicines / Stock by Category	What moves, and where stock is tied up

Profit here excludes VAT and uses true batch cost — the same basis as the Profit report, so the two always agree.

Managing branches

Menu → **Branches**. Only you can create or edit them.

What is shared, and what each branch keeps to itself

SHARED across every branch

Product catalogue & prices · Customers & loyalty points · Suppliers · Staff accounts · Settings
One paracetamol record, one customer record — wherever they shop.

Main Branch

MAIN

Its own stock quantities
Its own batches & costs
Its own sales & purchases
Its own reorder levels
Invoices: INV-000001

Bole Branch

Its own stock quantities
Its own batches & costs
Its own sales & purchases
Its own reorder levels
Invoices: BOL-000001

Gondar Branch

Its own stock quantities
Its own batches & costs
Its own sales & purchases
Its own reorder levels
Invoices: GON-000001

You can only sell stock your own branch holds — the till will not offer another branch's shelves

1 Add Branch

Name, city, phone, licence number. Set an **invoice prefix** such as **BOL-** so each branch's invoice numbers are distinguishable at a glance.

2 Assign a manager

Only Store Managers and Administrators can be chosen.

3 Assign staff to it

In Staff & Roles. A branch with no staff cannot trade.

4 Stock it

A new branch starts empty. Either record a purchase against it, or have a Store Manager transfer stock in.

Switching between branches

You are the only role that can. Use the shop icon in the top bar. **Everything on screen follows your selection** — the dashboard, stock, sales and reports. Check which branch you are in before reading a figure or recording anything.

Compare all branches in the same menu shows every product across every branch side by side. That is where you spot stock sitting idle in one branch while another has none.

Deactivating, not deleting. A branch with sales or purchases cannot be deleted — its history has to remain auditable. Mark it inactive instead. The main branch cannot be deactivated at all; make another branch the main one first.

Managing staff and roles

Menu → **Staff & Roles**. Choosing the role is the single most consequential decision here.

Who can do what

Permissions follow the job, not seniority — the Store Manager has no till, the Cashier has no stock screens

	Cashier	Pharmacist	Store Mgr	Admin
Use the till	✓	✓	✗	✓
See stock & expiry	✗	✓	✓	✓
Edit products & prices	✗	✗	✓	✓
See cost & profit	✗	✗	✓	✓
Record purchases	✗	✗	✓	✓
Void a sale	✗	✗	✗	✓
Settings & audit log	✗	✗	✗	✓

1 Add Staff

Name, username, email, phone, and — most importantly —
Role

2 Give them a temporary password

They will be forced to replace it on first sign-in, so you never know their working password.

3 Choose the role carefully

It decides everything they can reach. When in doubt, give less — you can always widen it.

4 Assign a branch

Every role except Administrator must have one, or they will have no stock to work with. Leave it blank **only** for Administrators — a blank branch is what grants the cross-branch view.

5 To remove someone, untick Active Employee

Do not delete. Deactivating blocks access while keeping their name on the sales and stock movements they made.

ROLE	GIVE IT TO SOMEONE WHO...
Cashier	Works the counter. Till, receipts, customers. No stock, no costs
Pharmacist	Dispenses. Everything a Cashier has, plus stock, expiry, batches and suppliers — but no costs
Store Manager	Buys and controls stock. Catalogue, purchases, stock corrections, costs, profit, exports. No till
Administrator	Runs the system. Everything, including settings, audit log, voids and backups. Keep this list short

Never create a shared login. The audit log records who did what; a shared account makes that record meaningless and removes any accountability.

The standard catalogue

This is now a platform-level function, not something any pharmacy's own Administrator account reaches — including yours.

What changed, and why

The standard catalogue (generic names, strengths, forms, legal classes, ATC codes) is shared reference data across every pharmacy on the platform, not this pharmacy's own data. Letting each pharmacy's Administrator browse or edit it directly meant one company's sloppy addition could quietly affect every other company's reports. It's now managed by platform staff only.

This doesn't block your staff from adding stock — Store Managers still search and link new medicines against the catalogue from **Add Medicine**, exactly as before, and it's still strongly recommended: it's what keeps the same medicine reading the same way across every pharmacy in reporting. It's no longer *required*, though — a genuine medicine that isn't on the catalogue can still be added, typed in by hand, and is simply flagged **Not Standardised** on the medicine list so it stays easy to reconcile later. What's gone is the separate "browse the catalogue" screen and the ability to add a new catalogue entry yourselves; if staff can't find something and it should really be standard, escalate it to platform administration to add.

If you also happen to be the platform administrator for this installation, that's a separate account and a separate part of the system (Pharmacies + Standard Catalogue, only visible when signed in as platform staff) — not something reachable from this pharmacy's own Administrator login.

Voiding a sale

Only you can do this. Menu → **Sales** → open the invoice → **Void**.

1 Confirm it is the right invoice

Check the number, customer and total against what you were told.

2 Type a real reason

"wrong item dispensed", "customer returned unopened pack" — this is what an auditor reads later.

3 Confirm

Every item returns to

the exact batch it came from

, so costing stays honest. The invoice stays on record marked **Voided** — it is never deleted, because a money record should not vanish.

A sale cannot be voided twice, and voiding is recorded against your name with the date and reason.

Deleting a purchase

Menu → **Purchases** → open it → **Delete**.

This reverses the stock the purchase added. **Units already sold are left alone** — clawing those back would corrupt both the stock count and the recorded cost of those sales.

The usual reason: a Store Manager saved a purchase with wrong figures. Delete it, then have them record it correctly.

The audit log

Menu → **Audit Log**. Restricted to you.

Every change is recorded with **who, what, when and from which network address**. It is **append-only** — nobody, including you, can edit or delete an entry. That is what makes it worth anything.

FILTER	USE IT TO ANSWER
Action = Deleted	What has been removed recently, and by whom
Action = Failed login	Is someone trying to guess a password? Repeated failures from one address deserve a look
Record Type = medicine.Medicine	Who has been changing prices or products
Search a username	Everything one person did, for a review or an investigation

Failed logins record only the attempted username — never the password.

Make it a habit. Five minutes a week on the Deleted and Failed login filters catches most problems while they are still small.

The stock ledger

Menu → **Inventory** → **Manage** → **Stock Ledger**.

Where did those packs go? The ledger answers it

DATE	CAUSE	CHANGE	BALANCE	REFERENCE
10 Sep 09:14	Purchase received	+100	500 → 600	PUR-000001
10 Sep 10:02	Sale	-30	600 → 570	INV-000001
10 Sep 11:30	Stock out (breakage)	-5	570 → 565	
10 Sep 14:05	Transfer out → Bole	-40	565 → 525	→ BR-002
10 Sep 16:20	Sale voided	+30	525 → 555	INV-000001

Nothing can change stock without appearing here. Entries are never edited or deleted.

The audit log records who changed a *record*. The stock ledger records every change to *stock* — and the two answer different questions. Use the ledger when a quantity is disputed.

It is complete by construction. Every path that changes stock writes here: purchases, sales, voids, deleted purchases, transfers (both sides), manual movements, stocktakes and opening balances. For any product, the ledger entries sum exactly to the current stock figure — if they ever did not, that would itself be the finding.

Settings

Menu → **Settings**. These flow through to the interface, receipts and labels.

SETTING	WHERE IT SHOWS UP / WHAT IT AFFECTS
Pharmacy name, logo	Sidebar, login page, receipts, shelf labels
Phone, email, address	Printed receipts
Licence number, TIN	Printed receipts — required for a compliant invoice
Currency	Every money figure in the system
Default Tax Rate	Pre-fills new products. Existing products keep their own rate
Invoice Prefix	Applied to <i>new</i> invoices only; existing numbers never change
Invoice Footer	Bottom of every customer receipt
Large Sale Alert Threshold	Sales at or above this raise a notification. Set it high enough to be meaningful, or it becomes noise
Currency per Loyalty Point	How much a customer spends to earn one point

Database backup and restore

Menu → **Settings** → **Download Backup**.

On SQLite (typical single-branch setup)

The button downloads the database file — a complete, directly restorable backup. Store it somewhere secure and off the machine: it contains every customer, sale and price in the pharmacy.

On PostgreSQL (larger deployments)

The button is **deliberately disabled**. A valid backup must be taken on the database server, and a browser download would produce an incomplete file — more dangerous than no backup, because you would trust it. The page shows the exact command:

```
pg_dump -U <user> -d pharmacare -F c -f pharmacare-backup.dump
```

A backup you have never restored is not a backup. Once a quarter, restore into a spare copy and check a few recent sales appear. Note how long it took — that is your real recovery time.

1

Daily

Automated backup, kept off the machine

2

Weekly

Verify the newest file opens and is a sensible size

3

Quarterly

Full restore test into a spare environment

4

Before any upgrade

Take one, and keep it until you are confident

Notifications and keeping alerts current

Stock, expiry and pending-payment alerts recalculate when someone opens the Notifications page and when **Refresh** is pressed. To keep them current overnight, schedule this with Windows Task Scheduler:

```
python manage.py refresh_notifications
```

- Program: `C:\path\to\venv\Scripts\python.exe`
- Arguments: `manage.py refresh_notifications`
- Start in: `C:\path\to\pharmacare`

Condition-based alerts clear themselves when the situation is fixed. Event alerts (new purchase, large sale) stay, because the event did happen.

Everything the other roles do

You can do all of it. The role guides cover each in detail — the essentials:

Same product bought twice at different prices

Older batch

40 pieces
cost 20 ETB each
was sold at 50 ETB

Newer batch

100 pieces
cost 30 ETB each
now sold at 60 ETB

Kept separate, forever

Each delivery keeps its own cost.
Nothing overwrites anything.
Soonest expiry is sold first.

You sell 50 pieces

40 from older batch

$40 \times 20 = 800$

+

10 from newer batch

$10 \times 30 = 300$

=

True cost of those 50

1,100 ETB

Money in (50×60 , VAT excluded)

3,000 ETB

Gross profit

Less true cost of goods

- 1,100 ETB

1,900 ETB

Buying more later at 45 ETB does not change this figure.

Older units are costed at the older price — which is why profit stays correct

Above: why the profit figures can be trusted. Each delivery keeps its own cost, soonest-expiry stock is dispensed first, and buying at a new price never rewrites the profit on sales already made.

TASK	WHERE	WATCH OUT FOR
Sell at the till	Point of Sale	Rx items prompt for confirmation
Record a delivery	Purchases → Record Purchase	Cannot be edited after saving
Add a product	Medicines → Add Medicine	Medicines must link to the Standard Catalogue first — non-medicine types don't need one
Correct a stock count	Inventory → Record Stock Movement	Stock Adjustment takes the counted total , not the difference
Write off expired stock	Stock Out	Put the reason in
Check batches and costs	Inventory → Batches	Shows the FEFO dispensing order

Reports and exports

All nine reports, all three formats. Access is per report — a Cashier sees three, a Pharmacist seven, you and the Store Manager see nine.

- **PDF** — send or file; renders Amharic correctly
- **Excel** — numbers arrive as numbers, so totals and sorting work
- **CSV** — for another system. Opens with Amharic intact in Excel

Every export carries a small footer noting it's AI-assisted output and should be verified before it leaves the pharmacy — check the figures against the screen before sending anything to a customer, supplier or regulator.

Security you are responsible for

CONTROL	STATE	YOUR JOB
Account lockout	On — 5 failures locks account and address for 30 minutes	Clear a genuine lockout; investigate repeats
Forced password change	On for new and reset accounts	Never bypass it
Password strength	10+ characters, mixed types	Do not relax it
Role-based access	Enforced server-side, not just hidden menus	Keep the Administrator list short
Audit log	Append-only	Review weekly
Secret key	Set in <code>.env</code>	Rotate from the shipped default before going live
HTTPS / secure cookies	Switch on automatically when <code>DEBUG=False</code>	Make sure production runs with <code>DJANGO_ENV=production</code>

Before going live, confirm three things: demo passwords changed, `DJANGO_SECRET_KEY` rotated, and a tested backup exists.

Working in Amharic

Press the  globe in the top bar and choose አማርኛ.

Switching changes everything: menus, buttons, warning messages, printed receipts and exported reports. Product names stay exactly as they were typed in, because those are your own data, not part of the system's wording.

Your choice sticks to your account, so a colleague on the same computer can work in English while you work in Amharic.

When something goes wrong

WHAT YOU SEE	WHAT IT MEANS	WHAT TO DO
A user is locked out	5 failed sign-ins	Wait for the 30 minutes, or clear the lockout. If it repeats, check the audit log for failed logins
Someone cannot reach a page they need	Their role does not include it	Change their role in Staff & Roles — do not work around it with a shared account
Stock and batch totals disagree	Stock changed outside the normal flow	Check Inventory → Batches for that product, then correct with a Stock Adjustment
A purchase was recorded wrongly	Purchases are immutable	Delete it (stock reverses), then have it re-entered
Profit report and Dashboard disagree	They should not — both use batch cost, net of VAT	Check the date ranges match; report a bug if they still differ
Amharic looks wrong in a CSV opened in Excel	Excel guessed the encoding	Use Data → From Text and choose UTF-8, or use the Excel/PDF export instead
Alerts are out of date	The refresh task is not running	Press Refresh, then check the scheduled task
Backup button disabled	You are on PostgreSQL, by design	Use the pg_dump command shown on the page
Site shows a plain error page	<code>DEBUG=False</code> , so details are hidden	Check the server log. Never turn DEBUG on in production to diagnose

If a patient may have been harmed — the wrong item dispensed, expired stock sold, a dosage mix-up — follow the pharmacy's clinical incident procedure **first**. The computer record can be corrected afterwards; patient safety cannot wait for paperwork.

Reporting a problem usefully

Tell your Administrator four things: **1)** what you were doing, **2)** what you expected, **3)** what actually happened (the exact wording of any message), **4)** your role and username. That is usually enough to fix it without a back-and-forth.

PharmaCare Management System · internal use only. Reports, invoices and exports are drafts for human review — check them before anything goes to a customer, supplier or regulator.
